## MX200 V10 <br> 200V 1A Piezo Driver

The MX200 is a complete power supply and highperformance linear amplifier module for driving piezoelectric actuators. The MX200 can drive stack actuators; standard piezoelectric actuators; two wire benders; and three-wire piezoelectric benders requiring a bias voltage. Output currents of up to 1 Amp are developed at frequencies up to 100 kHz with less than 100 uV noise ( 10 Hz to 10 kHz ). Bipolar output voltages up to $+/-100 \mathrm{~V}$ are possible with an external AC coupling capacitor.

The MX200 is protected against short-circuit, average current overload, and supply under-voltage. The MX200 can be used as a stand-alone module or mounted to a base with four M3 screws. The PCB mounting version (MX200-PCB) is supplied with headers for direct mounting onto a host motherboard.

| Inputs |  |
| :---: | :---: |
| In- | Neg. Input |
| In + | Pos. Input |
| Gnd | Ground |
| En | Enable |
| Vs | Supply |

| Outputs |  |
| :---: | :---: |
| Out | HV Output |
| Vb | Bias Voltage |
| Ovl | Overload |

Figure 2. MX200 Block Diagram

## Configuration

The output voltage range can be set to either +100 V , +150 V or +200 V using the two jumpers LK1 and LK2. Greater output current is available in the lower voltage ranges, as described in Table 1. Incorrect jumper combinations will damage the amplifier.

| Output <br> Voltage | Peak <br> Current | RMS <br> Current | Average <br> Current | LK1 | LK2 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 100 V | 1 A | 550 mA | 250 mA | A | Out |
| 150 V | 1 A | 330 mA | 150 mA | B | B |
| 200 V | 1 A | 220 mA | 100 mA | Out | A |

Table 1. Voltage Range Jumper Settings

## Output Current

The peak output current is 1 Amp for all voltage ranges but the maximum continuous RMS current is dependent on the voltage range, as described in Table 1. The average positive output current is also useful for calculating power dissipation and the average supply current. For a sine wave, the average positive output current is equal to

$$
I_{a v}=\frac{\sqrt{2}}{\pi} I_{r m s}=\frac{1}{\pi} I_{p k} .
$$

## Supply Current

The quiescent power for the amplifier and fan is approximately 8 W . Therefore, the quiescent supply current at 24 V is 0.3 A. This can be reduced to $<30 \mathrm{~mA}$ by applying a logic zero to the Enable pin. The supply current is related to the average positive output current by

$$
I_{s}=\frac{1.1 \times V_{o u t} \times I_{a v}+8}{V_{s}} .
$$

where $V_{\text {out }}$ is the output voltage range, and $I_{a v}$ is the average output current. Therefore, the maximum supply
current is 1.25 A with a 24 V supply at the full rated power ( $I_{a v}=100 \mathrm{~mA}$ ).

The power supply must be sufficient for the amplifier, a rating of at least 1.5 Amps is recommended. Note that when power is first applied or when the amplifier is enabled, full current will be required for a brief period to charge the storage capacitors.

## Applications Circuits

200 V Piezo stack driver.

Also suitable for benders with +100 V and -100 V bias.

+/-100 V Piezo Driver, see "Bipolar Output Voltage".

## Bias Output for Piezo Bimorphs

The bias output (Vb) provides a fixed voltage for driving three-wire piezoelectric benders. The bias voltage is approximately 5 V above the selected voltage range. The effective capacitance when using bimorph actuators is the sum of both layers.

Actuators that require a symmetrical bias voltage, e.g. $\pm 100 \mathrm{~V}$ can also be driven since this configuration is electrically identical to the unipolar configuration, e.g. OV to 200 V .

## Power Bandwidth

The nominal slew-rate of the MX200 is $60 \mathrm{~V} / \mathrm{us}$. Therefore, the maximum frequency sine-wave is

$$
f_{\max }=\frac{60 \times 10^{6}}{\pi V_{L(p-p)}}
$$

The unloaded power bandwidth for each voltage range is listed in Table 2.

| Voltage Range | Power Bandwidth |
| :---: | :---: |
| 200 V | 95 kHz |
| 150 V | 127 kHz |
| 100 V | 190 kHz |

Table 2. Unloaded power bandwidth
With a capacitive load, the power bandwidth is limited by the output current. The maximum frequency sine wave is

$$
f_{p w r}=\frac{I_{a v}}{V_{L(p-p)} C_{L}}
$$

where $I_{a v}$ is the average current limit, $V_{L(p-p)}$ is the peak-to-peak output voltage, and $C_{L}$ is the effective load capacitance. The power bandwidth for a range of load capacitance values is listed in Table 3.

| Load | Voltage Range |  |  |
| :---: | :---: | :---: | :---: |
| (uF) | 100 V | 150 V | 200 V |
| 0.01 | 190000 | 100000 | 50000 |
| 0.03 | 83333 | 33333 | 16667 |
| 0.1 | 25000 | 10000 | 5000 |
| 0.3 | 8333 | 3333 | 1667 |
| 1 | 2500 | 1000 | 500 |
| 3 | 833 | 333 | 167 |
| 10 | 250.0 | 100.0 | 50.0 |
| 30 | 83.3 | 33.3 | 16.7 |

Table 3. Power bandwidth (in Hz ) with a capacitive load
In the following figures, the maximum peak-to-peak voltage is plotted against frequency for each voltage range.

Figure 3. Power Bandwidth (200V Range)

Figure 4. Power Bandwidth (150V Range)

Figure 5. Power Bandwidth (100V Range)

## Signal Bandwidth

The small-signal bandwidth for a range of capacitive loads is listed in Table 4. The small-signal frequency responses are plotted in Figure 6.

| Load <br> Capacitance | Signal <br> Bandwidth |
| :---: | :---: |
| 10 nF | 180 kHz |
| 30 nF | 283 kHz |
| 100 nF | 275 kHz |
| 300 nF | 160 kHz |
| 1 uF | 78 kHz |
| 3 uF | 30 kHz |
| 10 uF | 8.3 kHz |
| 30 uF | 3.0 kHz |

Table 4. Small signal bandwidth (-3 dB)

Figure 6. Small signal frequency response

## Noise

The output noise contains a low frequency component ( 0.03 Hz to 10 Hz ) that is independent of the load capacitance; and a high frequency component ( 10 Hz to 1 MHz ) that is inversely related to the load capacitance.

Note that many manufacturers quote only the $A C$ noise measured by a multimeter ( 20 Hz to 100 kHz ) which is usually a gross underestimate.

The noise is measured with an SR560 low-noise amplifier (Gain = 1000), oscilloscope, and Agilent 34461A Voltmeter. The low-frequency noise is plotted in Figure 7. The RMS value is 360 uV with a peak-to-peak voltage of 1.8 mV .

Figure 7. Low frequency output noise ( 0.03 Hz to 10 Hz )
The high frequency noise ( 10 Hz to 1 MHz ) is listed in the table below versus load capacitance. The total noise from 0.03 Hz to 1 MHz is found by summing the RMS values, that is $\sigma=\sqrt{\sigma_{L F}^{2}+\sigma_{H F}^{2}}$.

| Load <br> Capacitance | HF <br> Noise | Total <br> Noise |
| :---: | :---: | :---: |
| 10 nF | 1.5 mV | 1.5 mV |
| 30 nF | 2.6 mV | 2.6 mV |
| 100 nF | 3.5 mV | 3.5 mV |
| 300 nF | 1.2 mV | 1.3 mV |
| 1 uF | 306 uV | 470 uV |
| 3 uF | 129 uV | 380 uV |
| 10 uF | 100 uV | 370 uV |
| 30 uF | 120 uV | 380 uV |

Table 5. HF Noise ( 10 Hz to 1 MHz ) and total noise
The majority of high-frequency noise is due to ripple from the boost converter (at 170 kHz ). In ultra-low noise applications, the output bandwidth can be restricted to 10 kHz which reduces the noise to less than 100 uV RMS in the 10 Hz to 1 MHz frequency range. This can be achieved with the RLC filter shown below.

## MX200

Figure 8. Output noise filter
The required inductance and resistance is

$$
L=\frac{1}{4 \pi^{2} f_{c}^{2} C_{L}} \quad \text { and } \quad R=1.4 \sqrt{L / C_{L}}
$$

where $f_{c}$ is the cut-off frequency ( 10 kHz ) and $C_{L}$ is the load capacitance. The inductor should be rated for at least 1 A with a self-resonance frequency of greater than 1 MHz .

A first-order resistive filter can also be effective, although it must be rated for the expected RMS current. The required value is

$$
R=\frac{1}{2 \pi f_{c} C_{L}}
$$

## Overload Protection / Shutdown

The MX200 is protected against short-circuit and average current overload. The module is also disabled when the input supply voltage is less than 12 V . Current overload conditions are signalled by +5 V on the Overload pin.

The amplifier can be shutdown manually by pulling the Enable pin low with an open-collector, or open-drain circuit. The Enable pin normally floats at 6.2 V and should not be driven directly.

## Bipolar Output Voltage

Bipolar output voltages can be achieved by adding an external AC coupling capacitor, as shown in the diagram below. This approach creates a high-pass filter with a cutoff frequency of 1 Hz . i.e., frequencies below 1 Hz will be strongly attenuated.
Up to $+/-100 \mathrm{~V}$ can be obtained using the 200 V range, or $+/-75 \mathrm{~V}$ using the 150 V range, or $+/-50 \mathrm{~V}$ using the 100 V range.

+/-100 V Piezo Driver, using an external capacitor C1 and resistor R1.

C1 should be rated for at least the full output voltage of the amplifier. For example, to achieve $+/-100 \mathrm{~V}$ using the 200 V configuration, a 250 V rated capacitor is required. The capacitance of C 1 should be large enough to ensure the series voltage drop is less than $1 \%$ of the output voltage. Film capacitors are preferred but electrolytic capacitors are also suitable.

If the load is a piezo or capacitor, $C 1>100 \times C_{p}$.

If the load is not capacitive at the operating frequency, the impedance of C1 should be less than 1\% of the load impedance $Z_{p}$, that is,

$$
C 1>\frac{100}{2 \pi f\left|Z_{p}\right|}
$$

The resistor R 1 sets the AC coupling frequency $f_{a c}$, which is recommended to be 1 Hz . The value of $R 1$ is

$$
R 1=\frac{1}{2 \pi f_{a c} C 1}
$$

The power rating of R1 should be greater than $V_{r m s}^{2} / R 1$, where $V_{r m s}$ is the RMS voltage across the load.

## Bridge Configuration

The output voltage range can be doubled to $\pm 200 \mathrm{~V}$ by driving the load in a bridged configuration as shown in Figure 9. In this configuration, the output voltage is

$$
V_{\text {out }}=40\left(V_{\text {in }}-5\right)
$$

That is, a 0 V to 10 V input produces $\pm 200 \mathrm{~V}$ at the load. Zero volts across the load occurs when the input voltage is +5 V . However, note that the absolute voltage of each terminal is still +100 V .

The power bandwidth for this configuration can be calculated by considering only one amplifier and doubling the effective capacitance.

Figure 9. Bridge configuration achieving $\pm 200 \mathrm{~V}$

## Safety

This device produces hazardous potentials and should be used by suitably qualified personnel. Do not operate the device when there are exposed conductors.

Parts of the circuit may store charge so precautions must also
 be taken when the device is not powered.

## Dimensions

The mounting posts accept M3 screws. For the PCB mounting version (MX200-PCB), a schematic and footprint library is available for Altium Designer. Refer to the online product details.
